

**Theorem (Möbius Inversion Formula)**  
 Suppose we have  $n \in \mathbb{Z}^+$  and numbers  $a_d$  for all divisors of  $n$ . Then the following system of linear equations in unknowns  $x_e$ ,  $e$  goes through all divisors of  $n$ :

$$\sum_{e|d} x_e = a_d \quad \text{for all } d|n \quad (1)$$

has the unique solution

$$x_e = \sum_{h|e} \mu\left(\frac{e}{h}\right) \cdot a_h \quad \text{for all } e|n \quad (2)$$

**Example:**  $n=12$ . Divisors of 12 are 1, 2, 3, 4, 6, 12.  
 The system is.

$$\begin{cases} x_1 & = a_1 \\ x_1 + x_2 & = a_2 \\ x_1 + x_3 & = a_3 \\ x_1 + x_2 + x_4 & = a_4 \\ x_1 + x_2 + x_3 + x_6 & = a_6 \\ x_1 + x_2 + x_3 + x_4 + x_6 + x_{12} & = a_{12} \end{cases} \quad (1)$$

Its solution is

$$x_1 = \mu(1) a_1 = a_1$$

$$x_2 = \mu(1) a_2 + \mu(2) a_1 = a_2 - a_1$$

$$x_3 = \mu(1) a_3 + \mu(3) a_1 = a_3 - a_1$$

$$x_4 = \mu(1) a_4 + \mu(2) a_2 + \mu(4) a_1 = a_4 - a_2$$

$$x_6 = \mu(1) a_6 + \mu(2) a_3 + \mu(3) a_2 + \mu(6) a_1$$

$$= a_6 - a_3 - a_2 + a_1$$

$$x_{12} = \mu(1) a_{12} + \mu(2) a_6 + \mu(3) a_4 + \mu(4) a_3 + \mu(6) a_2 + \mu(12) a_1 \\ = a_{12} - a_4 - a_6 + a_2.$$

Proof. We solve the system (1) with help of matrices. We can rewrite (1) in the following form:

~~$$M \cdot \underline{x} = \underline{a}$$~~

$$M \cdot \underline{x} = \underline{a}$$

where  $\underline{x} = (x_e)_{e \in n}$  is the vector of unknown numbers

$\underline{a} = (a_d)_{d \in n}$  is the vector of known numbers

$M = (m_{de})_{d,e \in n}$  is the matrix with

$$m_{de} = \begin{cases} 1 & \text{if } e \in d \\ 0 & \text{otherwise} \end{cases}$$

Example: for  $n=12$

$$M = \begin{pmatrix} 1 & 0 & 0 & 0 & 0 & 0 \\ 1 & 1 & 0 & 0 & 0 & 0 \\ 1 & 0 & 1 & 0 & 0 & 0 \\ 1 & 1 & 0 & 1 & 0 & 0 \\ 1 & 1 & 1 & 0 & 1 & 0 \\ 1 & 1 & 1 & 1 & 1 & 1 \end{pmatrix}$$

Notice that  $M$  is triangular with 1s on the diagonal.

$$\Rightarrow \det M = 1.$$

$\Rightarrow$  The system has a unique solution.

$$\underline{x} = \underline{M}^{-1} \underline{a} \text{ where } \underline{M}^{-1} \text{ is an inverse of } M.$$

We need to check that  $\underline{M}^{-1} = P = (P_{e,h})_{e,h|n}$

$$\text{where } P_{e,h} = \begin{cases} \mu(\frac{e}{h}) & \text{if } h|e \\ 0 & \text{otherwise.} \end{cases}$$

We consider the product  $M \cdot P$  and check that it coincides with the identity matrix  $I$ .

$$\begin{pmatrix} m_{11} & \dots & m_{1n} \\ \vdots & & \vdots \\ m_{d1} & \dots & m_{dn} \\ \vdots & & \vdots \\ m_{n1} & \dots & m_{nn} \end{pmatrix} \cdot \begin{pmatrix} p_{11} & \dots & p_{1h} & \dots & p_{1n} \\ \vdots & & \vdots & & \vdots \\ p_{n1} & \dots & p_{nh} & \dots & p_{nn} \end{pmatrix}$$

$\Downarrow$   $M$   $\Downarrow$   $P$

The entry  $(d,h)$  of the product is

$$\begin{aligned} m_{d1} p_{1h} + m_{d2} p_{2h} + \dots + m_{dn} p_{nh} &= \sum_{e|n} m_{de} p_{eh} \\ &= \sum_{e|n} \begin{cases} 1 & \text{if } e|d \\ 0 & \text{otherwise} \end{cases} \cdot \begin{cases} \mu(\frac{e}{h}) & \text{if } h|e \\ 0 & \text{otherwise} \end{cases} \end{aligned}$$

$$= \sum_{\substack{\text{all } e \text{ with} \\ e|d, h|e}} \mu\left(\frac{e}{h}\right) = \left[ \begin{array}{c} \text{change variables} \\ e = hk \end{array} \right]$$

$$= \sum_{\substack{\text{all } k \text{ with} \\ hk|d}} \mu(k) = \begin{cases} \sum_{k|d/h} \mu(k) \\ 0 \text{ if } h \nmid d \end{cases}$$

$$= [\text{by Proposition}] = \begin{cases} 1 & \text{if } d=h \\ 0 & \text{if } d \neq h. \end{cases}$$

This is exactly the entry  $(d, h)$  of  $I$ .

$$\Rightarrow P = M^{-1}$$

Corollary (Möbius Inversion Formula, version 2)  
Let two functions  $f(n), F(n)$  (not necessarily multiplicative) satisfy

$$F(n) = \sum_{d|n} f(d).$$

$$\text{Then } f(n) = \sum_{d|n} \mu\left(\frac{n}{d}\right) F(d).$$

(We take  $a_d = F(d)$ ,  $x_e = f(e)$  and apply MIF for all  $n \in \mathbb{Z}^+$ ).

Examples: (1)  $f(n) = 1 \leftarrow \text{constant}$ ,  $F(n) = \tau(n)$

$$\text{Then } \sum_{d|n} \mu\left(\frac{n}{d}\right) \tau(d) = 1$$

(2)  $f(n) = \varphi(n)$ ,  $F(n) = n$ .

Then MIF implies  $\varphi(n) = \sum_{d|n} \mu(d) \frac{n}{d}$

Then MIF implies  $\varphi(n) = \sum_{d|n} \mu\left(\frac{n}{d}\right) \cdot n$ .
